

THE RADIO NEUTRINO OBSERVATORY IN GREENLAND (RNO-G)

Jethro Stoffels
28th Nov 2024

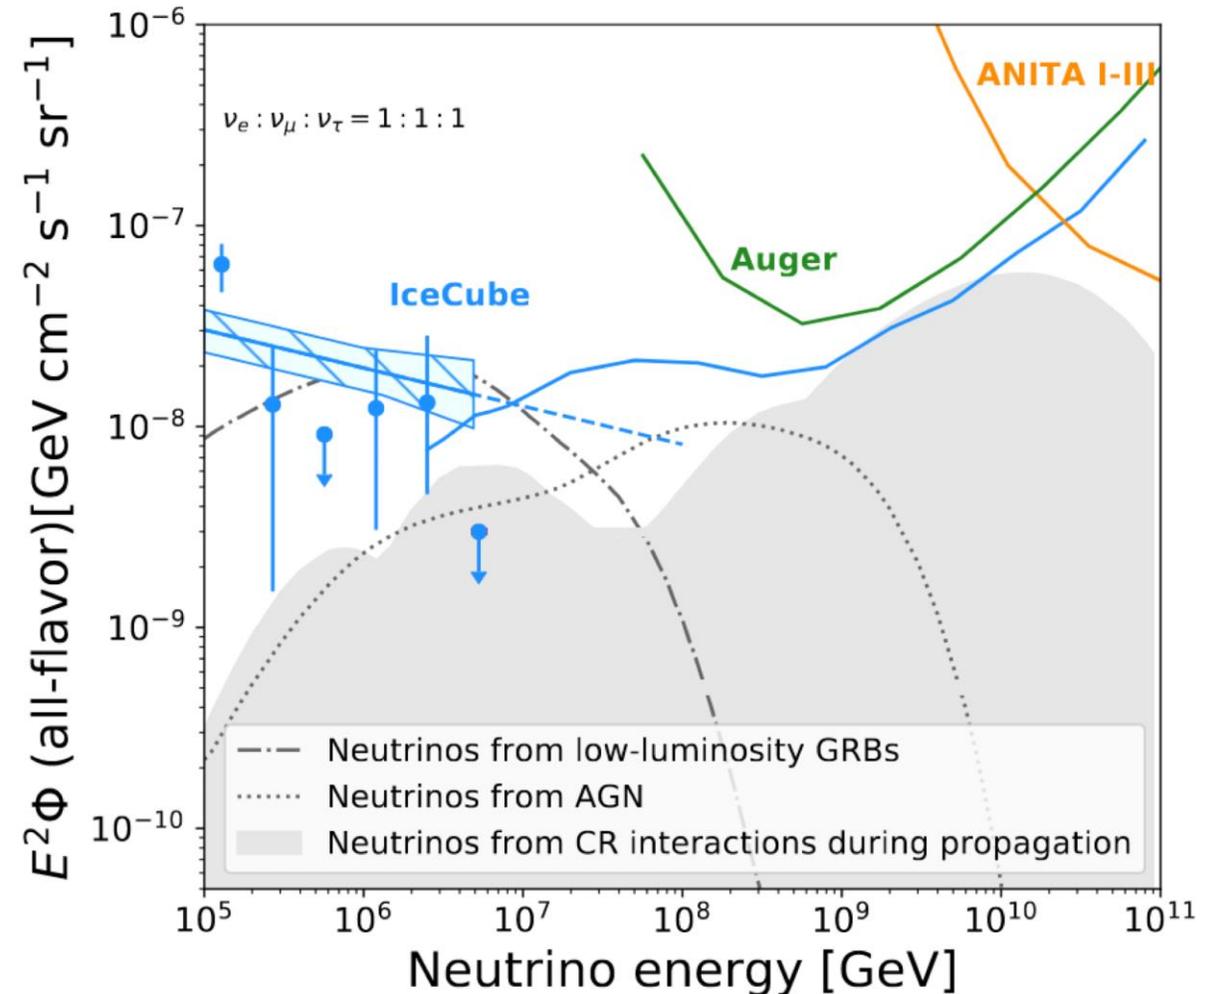

Neutrino astronomy

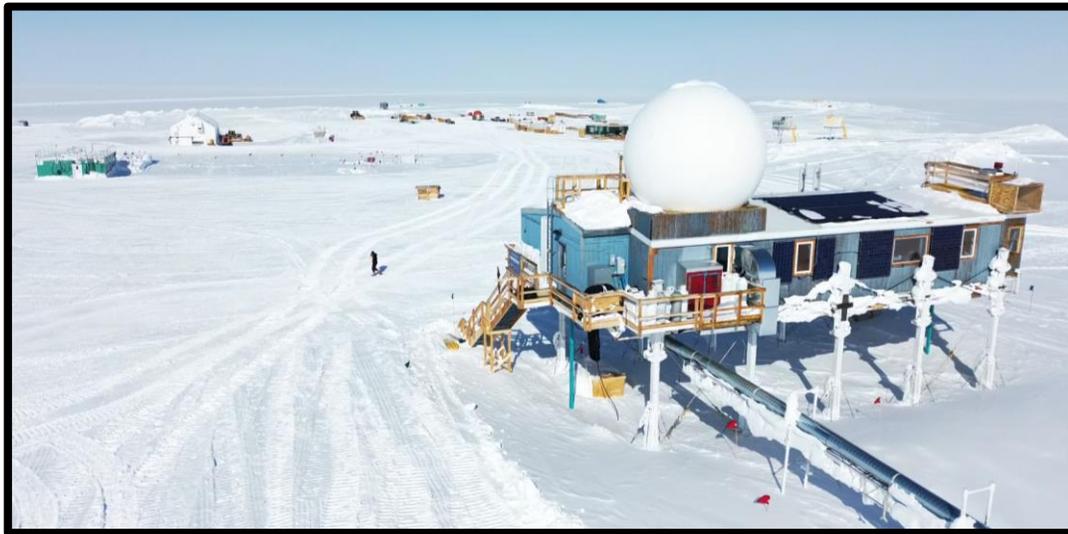

Neutrino astronomy

- $E < 10\text{PeV}$: IceCube
 $> 10\text{PeV}$: Terra Incognita
- Models predict Ultra high energy (100PeV – 10EeV) neutrino flux
 \Rightarrow want to observe flux or place limit
- Higher energy \Rightarrow Lower flux
 \Rightarrow 100 IceCubes required!

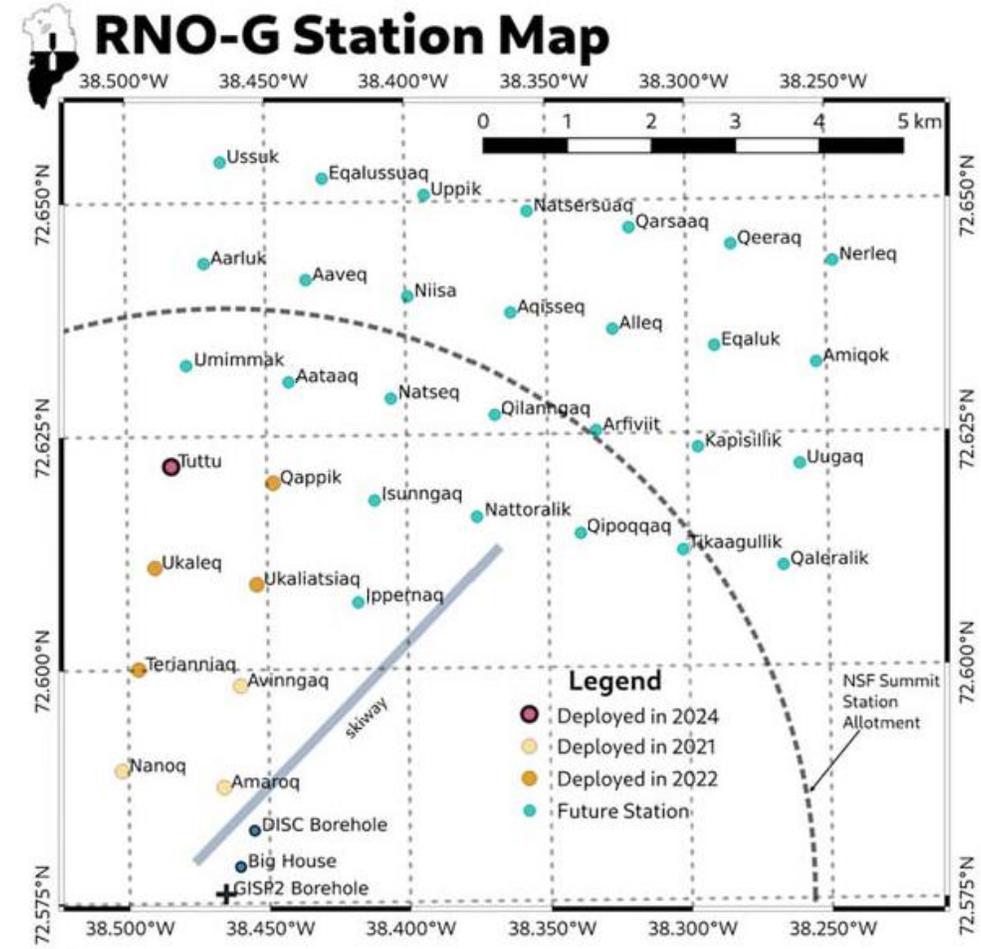

The RNO-G array

- Base sits atop 3km icesheet
- Infrastructure: Summit Station (NSF)

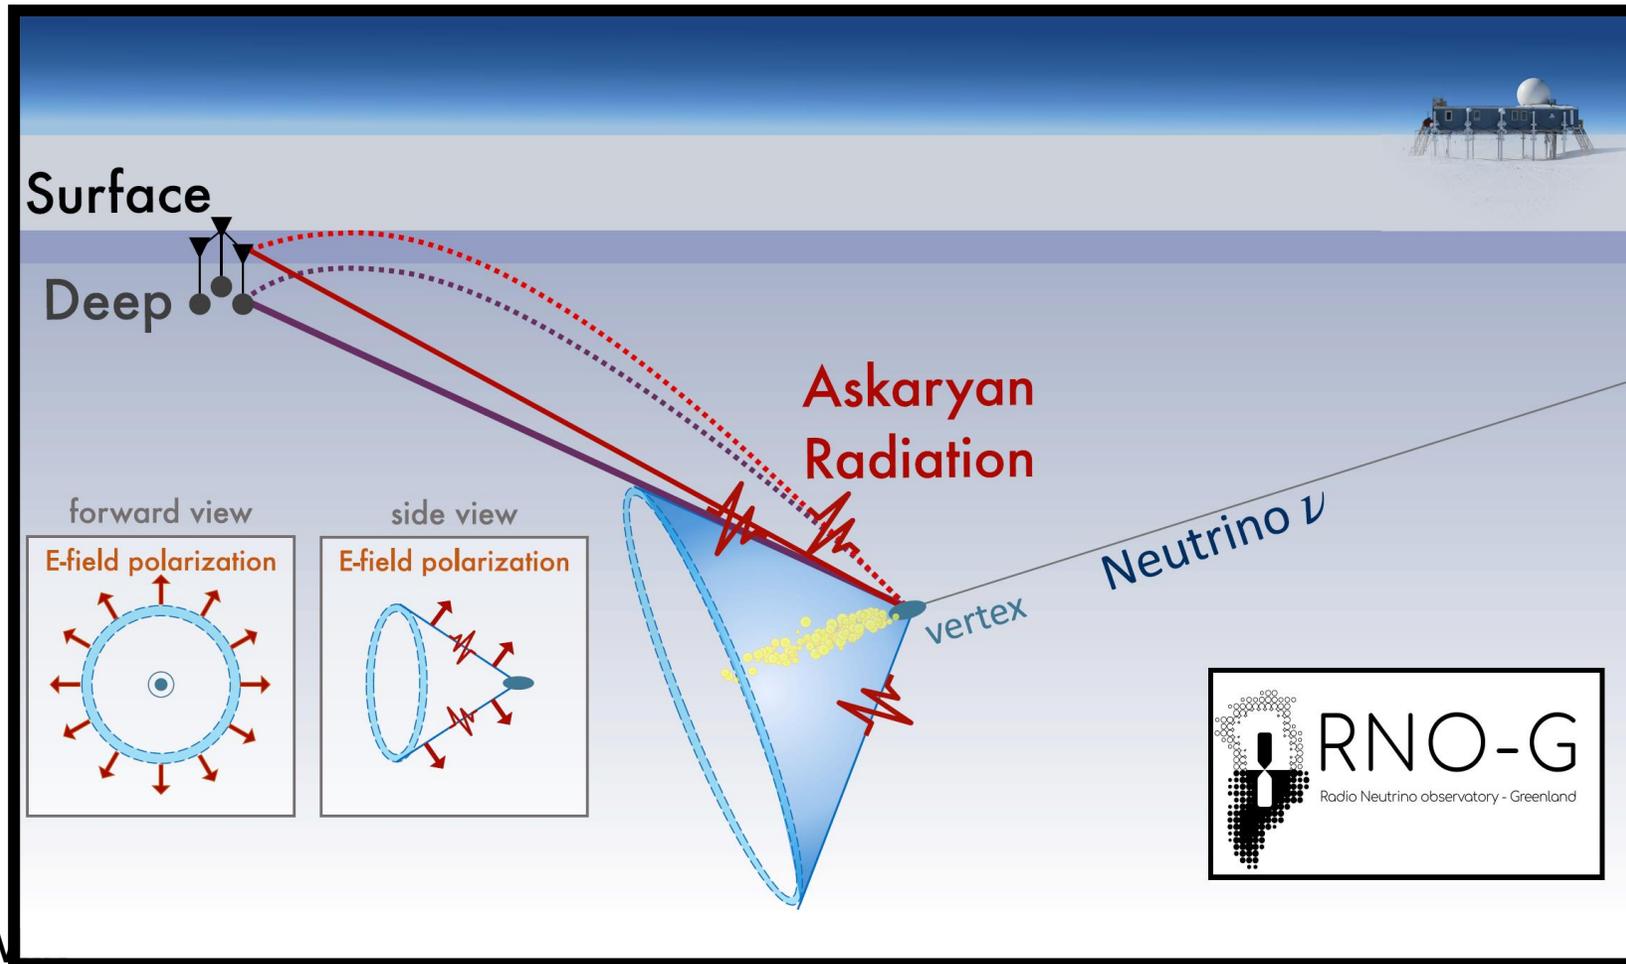

- 8 of the planned 35 stations installed
 - 1,25km interstation distance

Detection principle

- Charge excess \Rightarrow Askaryan radiation
- Coherence \Rightarrow cone shape

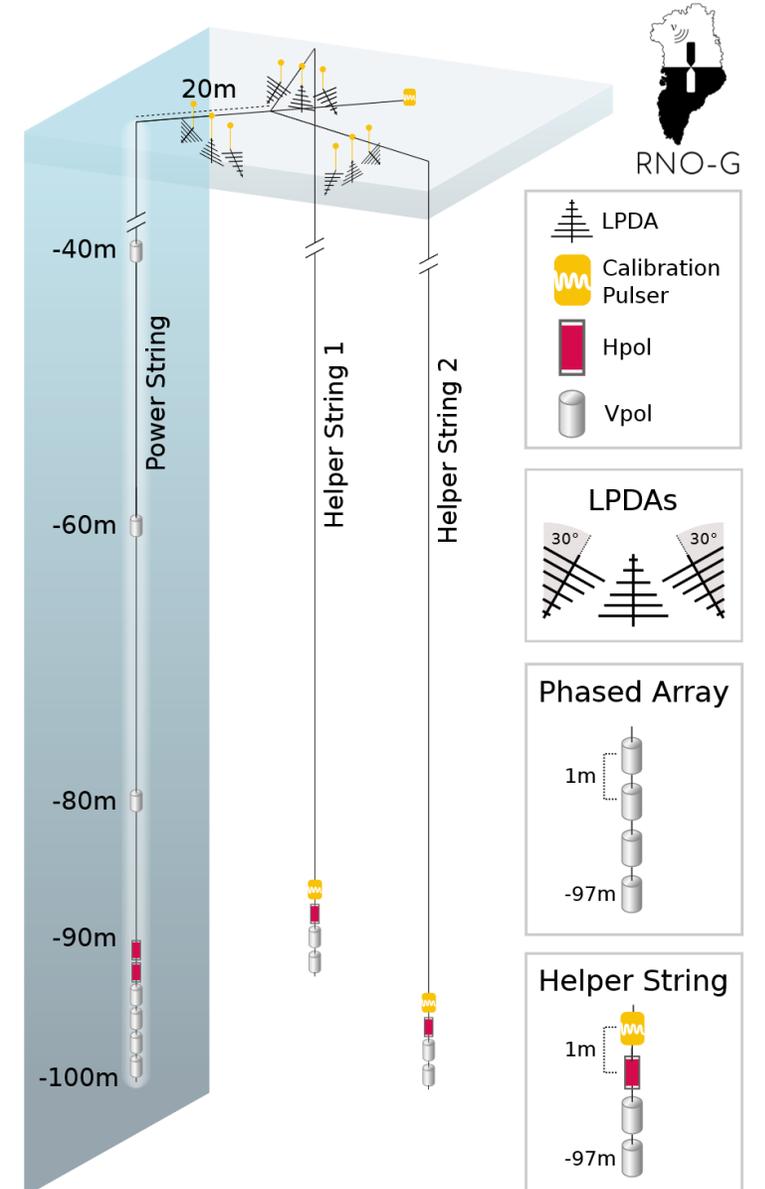

Station design

- 24 antennas/station
 - ⇒ 9 surface antennas ⇨ Bkg rejection veto
 - ⇒ 15 in-ice antennas:
 - Low threshold trigger
 - Phased array interferometry
 - Calibration pulsars

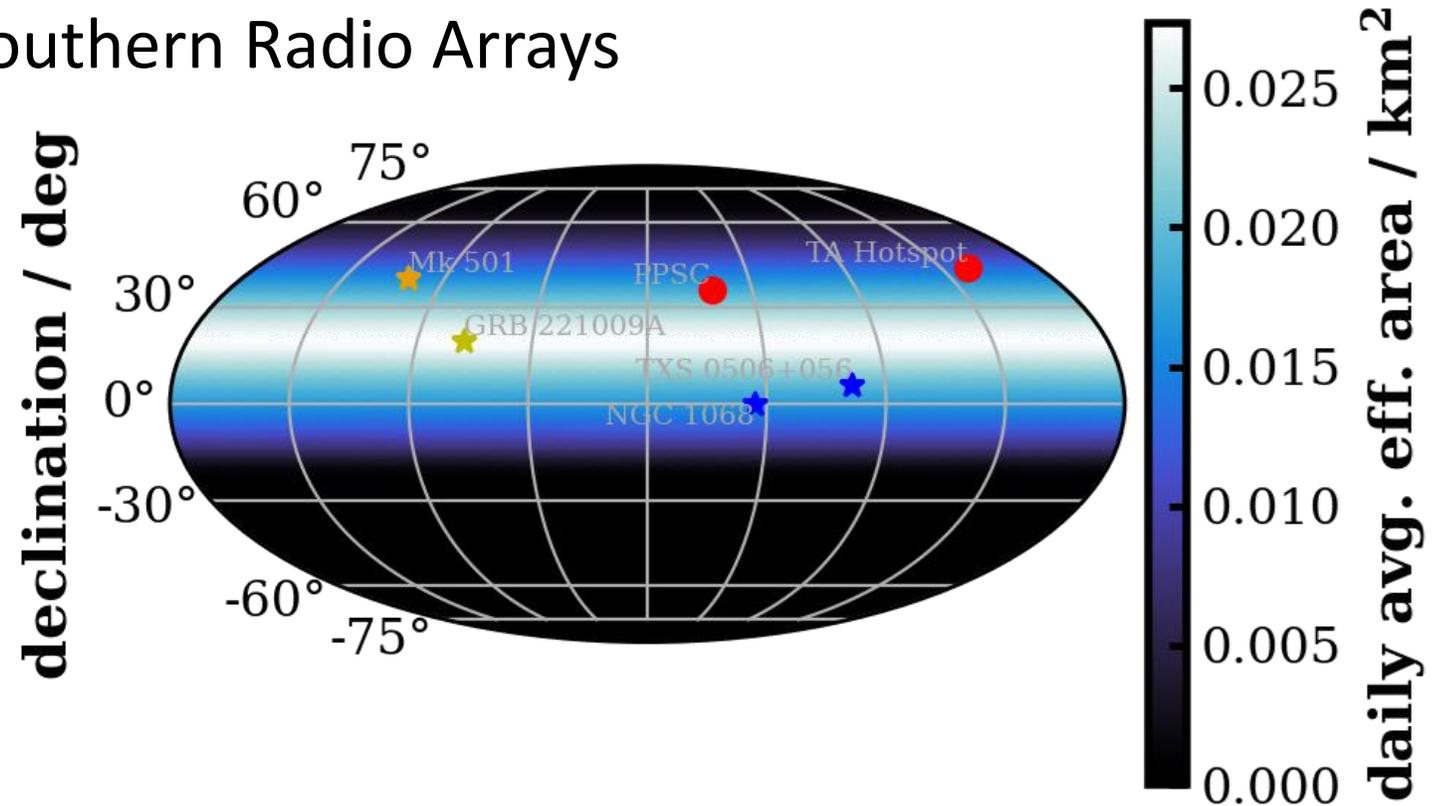

- Solar powered
 - ⇒ 7 months operational per year
 - ⇒ Extendable via wind power (WIP)

- Highly scalable!

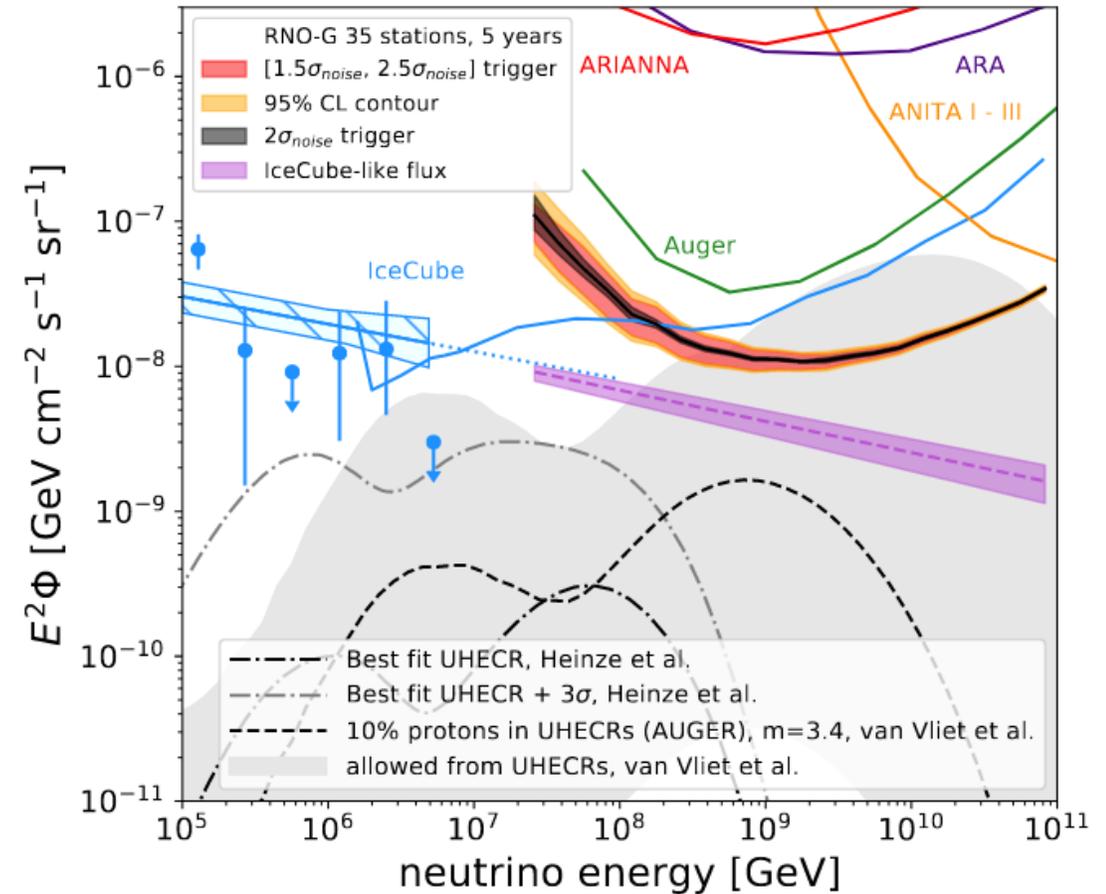

Field of view

- Overlapping with IceCube (but at different energies)
- Complementary to Southern Observatories
⇒ Complementary FoV to Southern Radio Arrays
- Covers popular sources
⇒ Multimessenger studies

Sensitivity

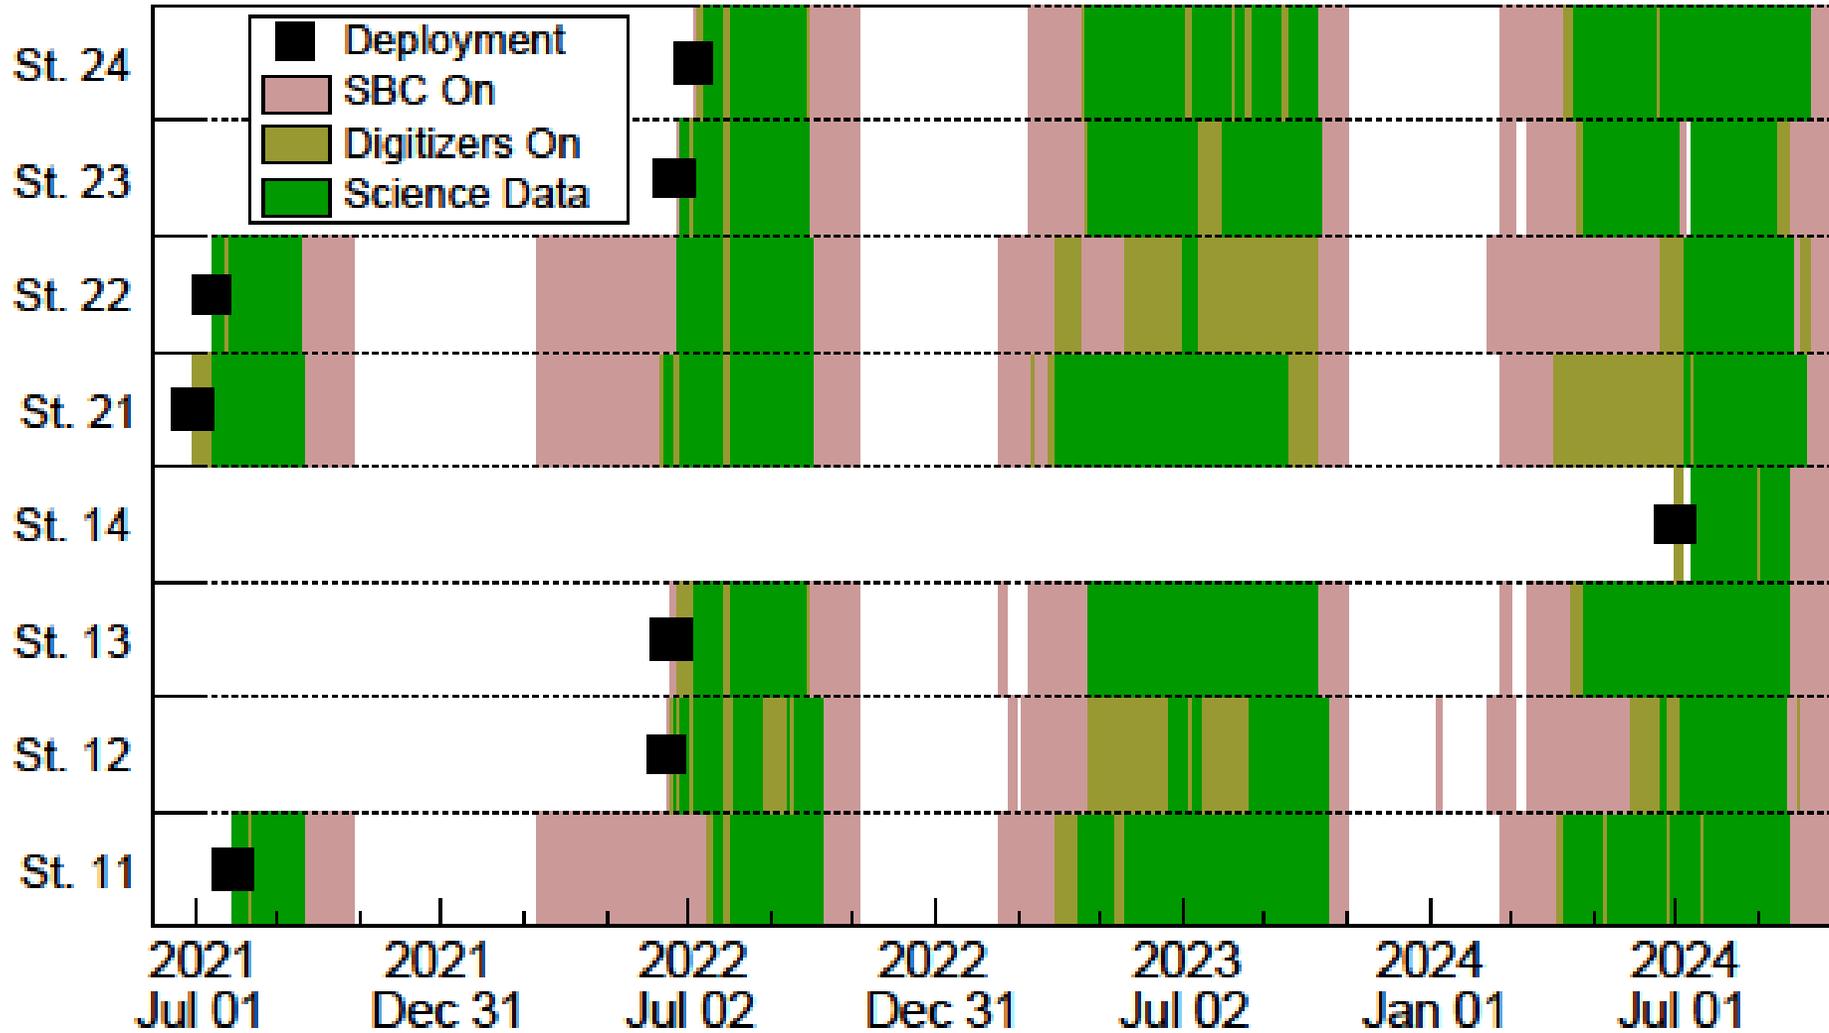

- World leading sensitivity @ 1EeV
- Testing optimistic cosmogenic neutrino models (grey)
- Testing extension of astrophysical source flux measured by IceCube

Performance

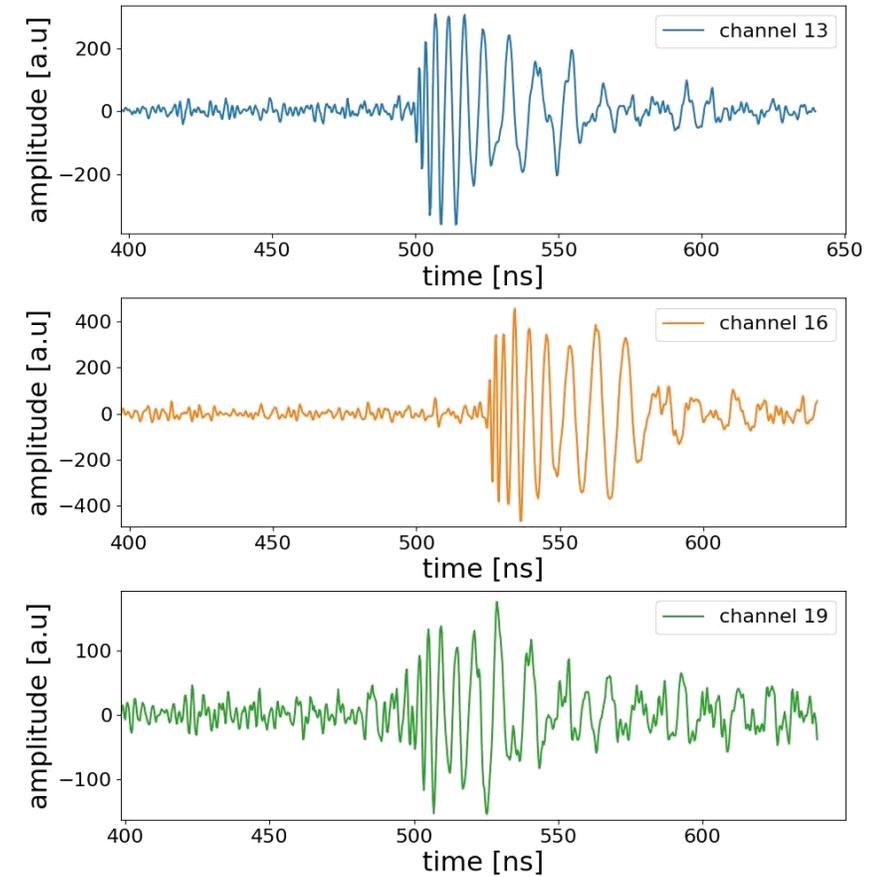

Solar flares

- Solar flare pointing: degree accuracy

CR Candidate event

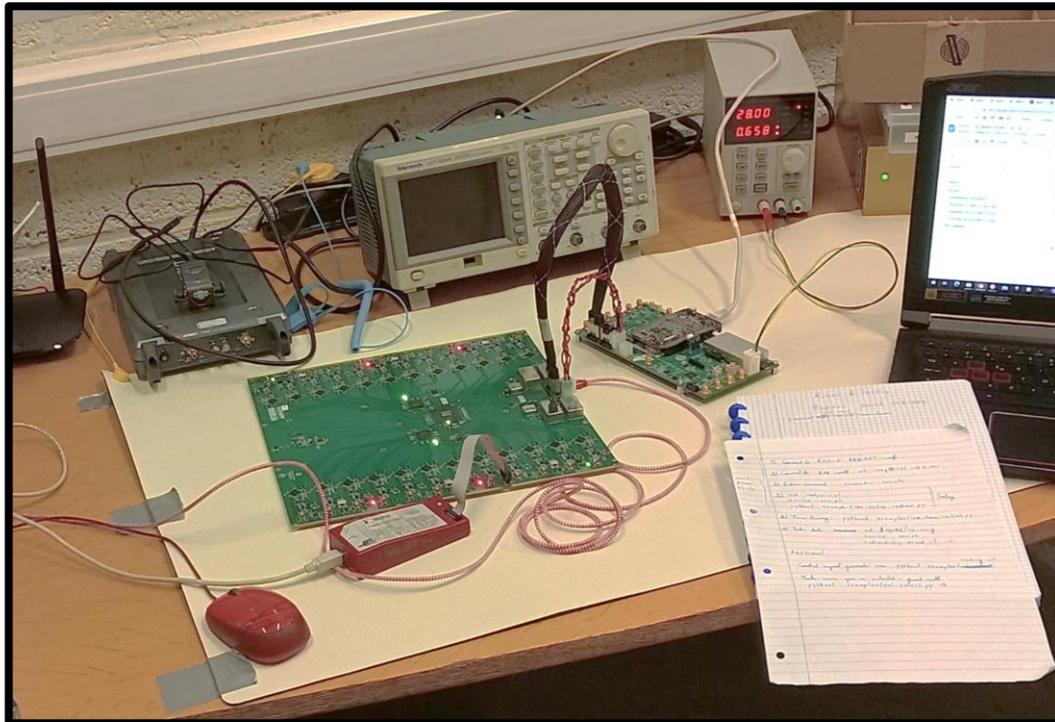

Source: PoS(ICRC2023)259, Full paper in preparation

RADIANT Production

- Total of 7 RADIANTS deployed in the ice
- Both production and testing done here

Cosmic ray airshower simulations

- Builds from FAERIE code
- Investigate CR VS neutrino signal characteristics

Galactic signal

- Transit curves (V_{RMS} vs LST) - Sim = Thermal + Galactic noise
- Good agreement for $T=266,1K$
 - Except for 18hr->21hr! (cf other experiments)
 - Still under investigation

- RNO-G:
 - 35 Stations (eight installed)
 - Array finished in few years
 - World leading sensitivity @ 1EeV
 - Strong case for multi-messenger astronomy
- Extensive group at IIHE led by Nick & Simona
- Contribute to various efforts:
 - Simulation tools
 - Deployment
 - Data analysis
 - Hardware production
