## Outline

## Part 1: Introduction to Flavour Physics

- What is flavour physics \& why is it interesting?
- Brief history of discovery in flavour physics
- CKM mechanism and Unitarity Triangle (UT)
- B-physics Experiments

## Part 2: CP violation \& CKM measurements (Triumphs of the SM)

- Meson-antimeson oscillations
- Introduction to CP violation
- Measurement of UT angles
- Measurement of UT sides

## Part 3: Search for New Physics

- Radiative Decays
- Tauonic Decays
- Purely Leptonic Decays

## Part 4: The future

- Future B experiments

## Neutral Meson Mixing

The eigenstates of flavour $\mathrm{M}^{0}$ anti- $\mathrm{M}^{0}$, degenerate in pure QCD, mix under weak interactions.
$\mathrm{M}^{0}$ : $\mathrm{K}^{0}$ (anti-s d), $\mathrm{D}^{0}\left(\mathrm{c}\right.$ anti-u), $\mathrm{B}^{0}\left(\right.$ anti-b d), $\mathrm{B}_{\mathrm{s}}{ }^{\circ}($ anti-b s)
Mixing can occur via short distance or long distance processes

Time dependent Schrödinger equation:

$$
i \frac{\partial}{\partial t}\binom{M^{0}}{\bar{M}^{0}}=H\binom{M^{0}}{\bar{M}^{0}}=\left(M-\frac{i}{2} \Gamma\right)\binom{M^{0}}{\bar{M}^{0}}
$$

$\mathbf{H}$ is Hamiltonian, $\mathbf{M} \& \Gamma$ are $2 \times 2$ Hermitian matrices
CPT Theorem: particle and antiparticle have equal masses \& lifetimes $\mathrm{M}_{11}=\mathrm{M}_{22}, \Gamma_{11}=\Gamma_{22}$
BND School, B physics \& CP Violation
Phillip URQUIJO

## Schrödinger equation

Physical states: eigenstates of the effective Hamiltonian

$$
M_{S, L}=p M^{0} \pm q \bar{M}^{0}
$$

CP conserved if physical states $=\mathrm{CP}$ eigenstates $(\mathbf{l q} / \mathbf{p} \mathbf{=}=\mathbf{1})$

Eigenvalues:

$$
\begin{gathered}
\lambda_{\mathrm{s}, \mathrm{~L}}=\mathrm{m}_{\mathrm{s}, \mathrm{~L}}-1 / 2 \mathrm{i} \Gamma_{\mathrm{s}, \mathrm{~L}}=\left(\mathrm{M}_{11}-1 / 2 \mathrm{i} \Gamma_{11}\right) \pm(\mathrm{q} / \mathrm{p})\left(\mathrm{M}_{12}-1 / 2 \mathrm{i} \Gamma_{12}\right) \\
\Delta \mathrm{m}=\mathrm{m}_{\mathrm{L}}-\mathrm{m}_{\mathrm{s}} \quad \Delta \Gamma=\Gamma_{\mathrm{s}}-\Gamma_{\mathrm{L}} \\
(\Delta \mathrm{~m})^{2}-1 / 4(\Delta \Gamma)^{2}=4\left(\left|\mathrm{M}_{12}\right|^{2}+1 / 4\left|\Gamma_{12}\right|^{2}\right) \\
\Delta \mathrm{m} \Delta \Gamma=4 \operatorname{Re}\left(\mathrm{M}_{12} \Gamma_{12}^{*}\right) \\
(\mathrm{q} / \mathrm{p})^{2}=\left(\mathrm{M}_{12}^{*}-1 / 2 \mathrm{i} \Gamma_{12}^{*}\right) /\left(\mathrm{M}_{12}-1 / 2 \mathrm{i} \Gamma_{12}\right)
\end{gathered}
$$

## Neutral Meson Mixing: 2 Mechanisms

$\Delta \mathbf{m}$ : value depends on rate of mixing diagram

$$
\begin{array}{r}
\Delta m_{d}=\frac{G_{F}^{2}}{6 \pi^{2}} m_{W}^{2} \eta_{b} S\left(x_{t}\right) m_{B_{d}} f_{B_{d}}^{2} \hat{B}_{B_{d}}\left|V_{t b}\right|^{2}\left|V_{t d}\right|^{2} \\
x=\frac{\Delta m}{\Gamma} \sim \mathcal{O}(1)
\end{array}
$$

$\Delta \Gamma$ : value depends on widths of decays into common final states (CP eigenstates) large for K, small for D and B

$$
y=\frac{\Delta \Gamma}{\Gamma} \sim \mathcal{O}(1)
$$

Note: CP violation in mixing when $\mid q / p l \neq 1$

## The Neutral Meson-Antimeson Systems

$$

## D Meson Mixing (\&CP Violation)

Inconsistent with no mixing point $(0,0)$

Consistent with no CP violation point $(1,0)$

LHCb making huge progress on CPV measurements.
Keep an eye out.

## CP Violation

## Formalism \& measurements in B decays

## CP Violation

CP violation caused by different interference effects in particle and antiparticle decays

One of the two amplitudes could be from mixing
Due to complex part of CKM matrix

$\begin{array}{cc}|A|^{2}= & |A|^{2}= \\ A_{1}^{2}+A_{2}^{2}+2 A_{1} A_{2} \cos (\Delta \phi+\Delta \delta) & A_{1}^{2}+A_{2}^{2}+2 A_{1} A_{2} \cos (-\Delta \phi+\Delta \delta)\end{array}$
For CPV A1 and A2 need to have different weak phases $\boldsymbol{\Phi}$ and different CP invariant (e.g. strong) phases $\bar{\delta}$

## CPV in Charged B decays

- Consider charged $B^{+} \rightarrow K \pi$ decays.
- For K- $\pi^{0}$, there are 3 diagrams, but only 1 for
 $\mathrm{K}^{0} \mathrm{~T}^{-}$

- However, because we don't know the strong phases its difficult to get useful information on the weak phases.

## Time Dependent CPV Formalism

## Consider arbitrary final state $f$

Decay amplitudes of flavour states

$$
\begin{aligned}
& A_{f} \equiv \mathcal{A}\left(P^{0} \rightarrow f\right)=\langle f| H\left|P^{0}\right\rangle \\
& \bar{A}_{f} \equiv \mathcal{A}\left(\bar{P}^{0} \rightarrow f\right)=\langle f| H\left|\bar{P}^{0}\right\rangle
\end{aligned}
$$

General time dependence of decay rate for initially pure flavour states

$$
\left.\begin{array}{ll}
\Gamma\left(P^{0} \rightarrow f\right)(t)= & \left|A_{f}\right|^{2}\left(1+\left|\lambda_{f}\right|^{2}\right) \frac{1}{2} e^{-\Gamma t}
\end{array} \quad\left[\cosh \left(\frac{1}{2} \Delta \Gamma t\right)+D_{f} \sinh \left(\frac{1}{2} \Delta \Gamma t\right)+C_{f} \cos (\Delta m t)-S_{f} \sin (\Delta m t)\right] .\right] ~\left[\begin{array}{ll} 
& \\
\Gamma\left(\bar{P}^{0} \rightarrow f\right)(t)=\left|A_{f}\right|^{2}\left|\frac{p}{q}\right|^{2}\left(1+\left|\lambda_{f}\right|^{2}\right) \frac{1}{2} e^{-\Gamma t} & {\left[\cosh \left(\frac{1}{2} \Delta \Gamma t\right)+D_{f} \sinh \left(\frac{1}{2} \Delta \Gamma t\right)-C_{f} \cos (\Delta m t)+S_{f} \sin (\Delta m t)\right]}
\end{array}\right.
$$

$$
D_{f}=\frac{2 \operatorname{Re}\left\{\lambda_{f}\right\}}{1+\left|\lambda_{f}\right|^{2}}, \quad C_{f}=\frac{1-\left|\lambda_{f}\right|^{2}}{1+\left|\lambda_{f}\right|^{2}}, \quad S_{f}=\frac{2 \operatorname{Im}\left\{\lambda_{f}\right\}}{1+\left|\lambda_{f}\right|^{2}}
$$

- For a given final state $f$, the parameter $\lambda_{f}$ fully describes the CPV in the decay (oscillation) of the meson

## Classification of CP-violating Effects

- Condition for CP conservation

$$
\left.\left.\left|\left\langle f_{\mathrm{CP}}\right| H\right| P^{0}(t)\right\rangle\left.\right|^{2}=\left|\left\langle f_{\mathrm{CP}}\right| H\right| \bar{P}^{0}(t)\right\rangle\left.\right|^{2}
$$

- CP Conservation implies

$$
\begin{aligned}
& \quad|q / p|=1 \\
& \left|\lambda_{f_{C P}}\right|=1 \\
& \operatorname{Im} \lambda_{f_{\mathrm{CP}}}=0
\end{aligned}
$$

1. CP violation in the decay (direct CP violation)

$$
\Gamma(P \rightarrow f) \neq \Gamma(\bar{P} \rightarrow \bar{f}) \Leftrightarrow\left|\frac{\bar{A}_{\bar{f}}}{A_{f}}\right| \neq 1
$$

2. CP violation in mixing (indirect CP violation)

$$
\Gamma\left(P^{0} \rightarrow \bar{P}^{0}\right) \neq \Gamma\left(\bar{P}^{0} \rightarrow P^{0}\right) \Leftrightarrow\left|\frac{q}{p}\right| \neq 1
$$

3. CP violation in mixing/ decay interference

$$
\Gamma\left(P^{0}\left(\rightsquigarrow \bar{P}^{0}\right) \rightarrow f\right)(t) \neq \Gamma\left(\bar{P}^{0}\left(\rightsquigarrow P^{0}\right) \rightarrow f\right)(t)
$$

## CP Violation <br> 1. Direct

## 1. Direct CP Violation: $\mathrm{B}^{\mathrm{o}} \rightarrow \mathrm{K}^{+} \Pi$

e.g.: $B \rightarrow K \pi$

Measure asymmetry between $\mathrm{B}^{\mathbf{0}} \rightarrow \mathrm{K}^{+} \boldsymbol{\pi}^{-}$and $\mathrm{B}^{\mathbf{0}} \rightarrow \mathrm{K}^{-} \boldsymbol{\pi}^{+}$

$$
|\overline{\mathcal{A}}|^{2}-|\mathcal{A}|^{2}=2\left|A_{1}\right|\left|A_{2}\right|\left[\cos \left(\arg \left(V_{t b}^{*} V_{t s}\right)+\Delta \delta\right)-\cos \left(\arg \left(V_{t b}^{*} V_{t s}\right)-\Delta \delta\right)\right]
$$

## Direct CP Violation $\mathrm{B}^{0} \rightarrow \mathrm{~K}^{+} \Pi$

2008 Nature 452 332. $\mathrm{M}_{\mathrm{bc}}\left(\mathrm{GeV} / \mathrm{c}^{2}\right)$

Discovered in 2004 (BaBar \& Belle)

$$
\begin{aligned}
& A_{c P}=\frac{N\left(\bar{B}^{0} \rightarrow K^{+} \pi^{-}\right)-N\left(B^{0} \rightarrow K^{-} \pi^{+}\right)}{N\left(\bar{B}^{0} \rightarrow K^{+} \pi^{-}\right)+N\left(B^{0} \rightarrow K^{-} \pi^{+}\right)} \\
& \mathrm{A}_{\mathrm{CP}}\left(\mathrm{~K}^{-} \pi^{+}\right)=-0.082 \pm 0.006 \\
& \mathrm{~A}_{\mathrm{CP}}\left(\mathrm{~K}^{-} \pi^{0}\right)=+0.040 \pm 0.021 \\
& \text { "K } \pi \text { puzzle" } \\
& P\left(B^{0} \rightarrow K^{+} \pi^{-}\right)>P\left(\bar{B}^{0} \rightarrow K^{-} \pi^{+}\right)
\end{aligned}
$$

Could be a sign of new physics ...
... but first need to rule out possibility of larger than expected QCD corrections

## How to rule out QCD effects?

- How to rule out QCD effects?
- Measure more $\mathrm{B}_{\mathrm{u}, \mathrm{d}} \rightarrow \mathrm{K} \pi$ decays \& relate by isospin
- Perform similar analyses on $B \rightarrow K^{\star} \pi \& / o r B \rightarrow K \rho$
- Measure $\mathrm{B}_{\mathrm{s}} \rightarrow K K$ decays \& relate by U-spin
First evidence of CPV in $B_{s}==>$

PRL 110 (2013) 221601

$$
A_{C P}\left(B_{s}^{0} \rightarrow K^{-} \pi^{+}\right)=0.27 \pm 0.04(\text { stat }) \pm 0.01 \text { (syst) }
$$

## Status of Direct CP Violation Measurements

Phillip URQUIJO

## CP Violation

## 2. Mixing

## CP violation in Mixing

$\boldsymbol{B}^{\boldsymbol{0}} \rightarrow \boldsymbol{X} \mathbf{I}^{+} \mathbf{v}$

- Lepton charge identifies $\mathrm{B}^{0}$ flavour in semileptonic decays:

$$
\begin{aligned}
& B^{0}: b \rightarrow \bar{c} \ell^{+} \nu \\
& \bar{B}^{0}: \bar{b} \rightarrow c \ell^{-} \bar{\nu}
\end{aligned}
$$

$$
\text { If } \mathrm{CPV} \Rightarrow P\left(B^{0} \rightarrow \bar{B}^{0}\right) \neq P\left(\bar{B}^{0} \rightarrow B^{0}\right)
$$

- Probability to observe two negatively charged leptons
- Probability to observe two positively charged leptons
- $\mathbf{N}^{--} \neq \mathbf{N}^{++}$

$$
A_{C P}=\frac{P\left(\bar{B}^{0} \rightarrow B^{0}\right)-P\left(B^{0} \rightarrow \bar{B}^{0}\right)}{P\left(\bar{B}^{0} \rightarrow B^{0}\right)+P\left(B^{0} \rightarrow \bar{B}^{0}\right)}=\frac{N^{++}-N^{--}}{N^{++}+N^{--}}=\frac{1-\left|\frac{1}{p}\right|^{4}}{1+\left|\frac{1}{p}\right|^{4}}
$$

## CP violation in Mixing

Starting from a pure $\left|B^{0}\right\rangle$ state, the wave function evolves as

$$
\mathrm{A}(\Delta t)=\frac{N^{+-}-N^{ \pm \pm}}{N^{+-}+N^{ \pm \pm}} \sim \cos \Delta m \Delta t
$$

$$
\mathrm{N}^{++}-\mathrm{N}^{--/} \mathrm{N}^{++}+\mathrm{N}^{--}=1-|q / p|^{4} / 1+|q / p|^{4}
$$

$$
\Rightarrow|q / p|=1.0024 \pm 0.0023
$$

$\Rightarrow$ CPV in mixing negligible in B system

## CPV in Mixing: Semileptonic $\mathrm{B}_{\mathrm{s}}$ decays

- D0: $\mu \mu$ inclusive - similar to $\mathrm{Y}(4 \mathrm{~S})$ approach (subtract effect of $\mathrm{B}_{\mathrm{d}}$ ) -3.9 ${ }^{\text {from SM! }}$
- LHCb \& DO: $\mathrm{D}_{\mathrm{s} \mu}$ (purified $\mathrm{B}_{\mathrm{s}}$ sample)

$$
a_{s l}^{s} \equiv \frac{\Gamma\left(\bar{B}_{s}^{0} \rightarrow D_{s}^{-} \mu^{+}\right)-\Gamma\left(B_{s}^{0} \rightarrow D_{s}^{+} \mu^{-}\right)}{\Gamma\left(\bar{B}_{s}^{0} \rightarrow D_{s}^{-} \mu^{+}\right)+\Gamma\left(B_{s}^{0} \rightarrow D_{s}^{+} \mu^{-}\right)}
$$

$\Rightarrow$ agrees with SM

## CPV in Mixing: Semileptonic $B_{s}$ decays

- D0: $\mu \mu$ inclusive - similar to $\mathrm{Y}(4 \mathrm{~S})$ approach (subtract effect of $\mathrm{B}_{\mathrm{d}}$ ) - $3.9 \sigma$ from SM!
- LHCb \& DO: $\mathrm{D}_{\mathrm{s} \mu}$ (purified $\mathrm{B}_{\mathrm{s}}$ sample)

$$
a_{s l}^{s} \equiv \frac{\Gamma\left(\bar{B}_{s}^{0} \rightarrow D_{s}^{-} \mu^{+}\right)-\Gamma\left(B_{s}^{0} \rightarrow D_{s}^{+} \mu^{-}\right)}{\Gamma\left(\bar{B}_{s}^{0} \rightarrow D_{s}^{-} \mu^{+}\right)+\Gamma\left(B_{s}^{0} \rightarrow D_{s}^{+} \mu^{-}\right)}
$$

$\Rightarrow$ agrees with SM

## CP Violation

3. Interference

### 3.1 Measurement of angle $\beta$ using CP eigenstates

More precisely: CP violation in interference between decay w/ and w/o mixing
The "Golden Decay": $\quad \boldsymbol{B}^{\mathbf{0}} \rightarrow \mathbf{J} / \boldsymbol{\Psi} \mathbf{K}^{\mathbf{0}}$
(theoretically clean: tree diagram dominates)

$$
\begin{aligned}
& \begin{array}{|c|}
\hline \bar{b}-B^{0} \text { mixing } \\
\mathbf{v}_{\mathrm{tb}^{*}} \mathrm{v}_{\mathrm{td}}-\bar{d} \\
\vdots \\
\vdots \\
d-\mathrm{v}_{\mathrm{td}} \\
\hline \\
q / p \approx \mathrm{v}_{\mathrm{tb}}{ }^{*}-b \\
q / p e^{-i 2 \beta} \\
\hline
\end{array} \\
& \text { Select } K_{S} \text { through decays } \\
& \left|K_{s}^{0}\right\rangle \approx p\left|K^{0}\right\rangle+q\left|\bar{K}^{0}\right\rangle \quad K_{s}^{0} \rightarrow \pi^{+} \pi^{-} \\
& \left|K^{0}\right\rangle=\frac{1}{2 p}\left(\left|K_{S}\right\rangle+\left|K_{L}\right\rangle\right) \quad K_{L}^{0} \rightarrow \pi^{+} \pi^{-} \pi^{0}, \pi^{-} \ell^{+} \nu \\
& \text { decay } \\
& \text { decay + mixing } \\
& \arg \left(\mathrm{V}_{\mathrm{cs}} \mathrm{~V}_{\mathrm{cb}}{ }^{*}\right)-\arg \left(\mathrm{V}_{\mathrm{td}}{ }^{2} \mathrm{~V}_{\mathrm{tb}}{ }^{2} \mathrm{~V}_{\mathrm{cb}} \mathrm{~V}_{\mathrm{cs}}{ }^{*} \mathrm{~V}_{\mathrm{cs}}{ }^{2} \mathrm{~V}_{\mathrm{cd}}{ }^{*}{ }^{2}\right)=-2 \beta
\end{aligned}
$$

## "Golden-Decay" Event in the BaBar Detector

## Time dependent asymmetry

- Define the time-dependent CP asymmetry

$$
A_{C P}(t)=\frac{N\left(\bar{B}^{0}(t) \rightarrow J / \psi K_{s}^{0}\right)-N\left(B^{0}(t) \rightarrow J / \psi K_{s}^{0}\right)}{N\left(\bar{B}^{0}(t) \rightarrow J / \psi K_{s}^{0}\right)+N\left(B^{0}(t) \rightarrow J / \psi K_{s}^{0}\right)}=\sin (2 \beta) \sin (\Delta m t)
$$

- We can measure the angle of the UT

What do we have to do to measure $A_{C P}(t)$ ?

- Step 1: Produce and detect $B^{0} \rightarrow f_{C P}$ events
- Step 2: Separate $B^{0}$ from $\bar{B}^{0}$
- Step 3: Measure the decay time $t$

## Measuring time dependent CP asymmetries

## Summary for $\alpha$

$\alpha[$ WA, $a l l]=\left(88.5^{+4.7}-4.4\right)^{\circ}$

### 3.3 Angle $\gamma$ from $B \rightarrow D K$

Theoretically clean measurement of $\gamma$ in the interference between the decays $B \rightarrow D^{0} K$ and $B \rightarrow \bar{D}^{0} K$

the only CP violating parameter that can be measured through tree decays
Common parameters:
CKM angle $\gamma$

$$
\frac{\left\langle B \rightarrow \overline{D^{0}} K\right\rangle}{\left\langle B \rightarrow D^{0} K\right\rangle}=r_{B} e^{i\left(\delta_{B}-\gamma\right)}
$$

Amplitude ratio $r_{\mathrm{B}}$
Strong phase difference $\delta_{B}$

$$
r_{B} \sim \frac{\left|V_{u b} V_{c s}^{*}\right|}{\left|V_{c b} V_{u s}^{*}\right|} \times \mid \text { col.supp } \mid=0.1-0.2
$$

Precision on $\gamma$ very sensitive to value of $r_{B}$

## Dalitz Plot Method

Reconstruct D in final states accessible to both $D^{0}$ and $\overline{D^{0}}$
Study interference pattern in $\mathrm{D}^{0}\left(\right.$ anti- $\left.\mathrm{D}^{0}\right)$ Dalitz plot for

$$
\begin{aligned}
& B^{\mp} \rightarrow D\left(K_{s} h^{+} h^{-}\right) K^{\mp}
\end{aligned}
$$

Sensitivity varies over Dalitz plane Input: D decay amplitude $\rightarrow$ model uncertainty

Simultaneous fit to Dalitz plot density for $\mathrm{B}^{+}$and $\mathrm{B}^{-}$decays in data BND School, B physics \& CP Violation Phillip URQUIJO 39

## Angle $\gamma$ from B $\rightarrow \mathrm{DK}$

$$
\begin{aligned}
& x_{ \pm}=r_{B} \cos \left(\delta_{B} \pm \gamma\right) \\
& y_{ \pm}=r_{B} \sin \left(\delta_{B} \pm \gamma\right)
\end{aligned}
$$

## PRD 85, 112014 (2012).

r_{B}=0.145 \pm 0.030 \pm 0.011 \pm 0.011 \\
\delta_{B}=(129.9 \pm 15.0 \pm 3.9 \pm 4.7)^{\circ} \\
\text { model error }
\end{gathered}
$$

$$
\begin{aligned}
& \gamma=(76 \pm 22 \pm 5 \pm 5)^{c} \\
& B \rightarrow D K, D^{*} K, D K^{*} \\
& D \rightarrow K_{s} \pi^{+} \pi^{-}, K_{s} K^{+} K^{-}
\end{aligned}
$$

Difference in Belle \& BaBar stat. errors due to values of $r_{B}$

## $\gamma$ from combination of $\mathrm{B}^{+} \rightarrow \mathrm{DK}^{+}$modes

- All direct CPV effects caused by $\gamma$ in SM
- Negligible theory uncertainty
- Several B and D decays used
- Combination: from GLW/ADS ( $\mathrm{D} \rightarrow \mathrm{hh}$ ) \& GGSZ ( $\mathrm{D} \rightarrow \mathrm{K}$ shh )

BaBar PRD 87 (2013) 052015
Belle CKM2012 preliminary LHCb-PAPER-2013-020 \& LHCb-CONF-2013-006
$\gamma$ [BaBar] $=(69 \pm 17)^{\circ}$
$y[B e l l e]=(68 \pm 14)^{\circ}$
$\mathrm{y}[\mathrm{LHCb}]=(69+11-13)^{\circ}$
Y [combined] $=(68.0+8.0-8.5)^{\circ}$

### 3.4 The $\mathrm{B}_{\mathrm{s}}$ CKM angle $\beta_{\mathrm{s}}$

- Analogous to $B \rightarrow J / \psi K$, time dependent CPV in $B_{s}$

$$
S_{\Psi \phi} \equiv " \sin \phi_{s} "=\sin \left(-\mathbf{2} \boldsymbol{\beta}_{s}^{\mathrm{SM}}+\phi_{s}^{\mathrm{NP}}\right)
$$

- In contrast to $\beta$, CKM angle $\beta_{s}$ is very small

$$
-2 \beta_{s}^{S M}=(-2.08 \pm 0.10)^{\circ}
$$

(PRD83, 036004 (2011))

- Two interesting modes

pseudoscalar to vector vector decay
Fit with 10 physics parameters:
7 angular amplitudes and phases +
$\Gamma \mathrm{s}, \Delta \Gamma \mathrm{s}, \phi \mathrm{s}$

vector-pseudoscaler final state ("S-wave")
single CP odd eigenstate no angular analysis needed

## $\mathrm{B}_{\mathrm{s}}{ }^{\mathrm{o}} \rightarrow \mathrm{J} / \psi \phi$ analysis

## CP violation in $\mathrm{B}_{\mathrm{s}} \rightarrow \mathrm{J} / \psi \phi$ \& $\mathrm{J} / \psi \pi \pi$

## Measurements of Sides: The Left Side $\mathrm{R}_{\mathrm{u}}$

## Semileptonic Decays

Decay properties depend directly on $\left|V_{c b}\right| \&\left|V_{u b}\right|$ and $m_{b}$ : perturbative $\left(a_{s}{ }^{n}\right)$.

- $\left|\mathrm{V}_{\mathrm{ub}}\right| \approx 0.004$ the smallest element - not easy!

## Semileptonic Decays

$$
\mathrm{B} \rightarrow \mathrm{Dev}
$$

Decay properties depend directly on $\left|V_{c b}\right| \&\left|V_{u b}\right|$ and $m_{b}$ : perturbative $\left(a_{s}{ }^{n}\right)$.

Quarks are bound in hadrons. Interactions of $b$-quark \& lightquark in the $B$ are very important.

- $\left|\mathrm{V}_{\mathrm{ub}}\right| \approx 0.004$ the smallest element - not easy!

## Measurements of $\left|V_{c b}\right|$ \& $\left|V_{u b}\right|$

2 Approaches in B decays
Inclusive $X_{u, \mathrm{c}}=$ sum of all final states.
Framework: Operator Production Expansion.
Exclusive $X_{c}=D, X_{u}=\pi$ : Specific final state. Theory: Lattice QCD.

Different theory frameworks. Cross check each other.

## IV $\mathrm{V}_{\mathrm{cb}}$ I Determination

$\left|\mathrm{V}_{\mathrm{cb}}\right|, \mathrm{m}_{\mathrm{b}}$ \& $b$ fermi motion extracted from Semileptonic (and Radiative) spectra.

Inconsistent
-New Physics unlikely
-b-quark dynamics?
-Problem with measurements?

Mass \& Flavour

Global fit from 6 experiments

Phillip URQUIJO

## $\left|V_{u b}\right|$

- Problem: $b \rightarrow$ clv rate $50 x$ larger
- Overcoming this background increases Fermi motion dependence.

# UT sides 

$\mathbf{R}_{\mathrm{t}}$

## The Right Side $\mathrm{R}_{\mathrm{t}}$

Must use loop processes where $b \rightarrow t \rightarrow d$

## $V_{t d}$ from B Mixing

- Relation between B mixing \& CKM elements:

$$
\mathrm{x} \equiv \frac{\Delta \mathrm{~m}}{\Gamma}=\frac{\mathrm{G}_{\mathrm{F}}^{2}}{6 \pi^{2}} \mathrm{~B}_{\mathrm{B}} \mathrm{f}_{\mathrm{B}}^{2} \mathrm{~m}_{\mathrm{B}} \tau_{\mathrm{B}}\left|\mathrm{~V}_{\mathrm{tb}}^{*} \mathrm{~V}_{\mathrm{td}}\right|^{2} \overbrace{\mathrm{t}}^{2} \mathrm{~F}\left(\frac{\mathrm{~m}_{\mathrm{t}}^{2}}{\mathrm{~m}_{\mathrm{W}}^{2}}\right) \eta_{\mathrm{QCD}}
$$

- $F$ is a known function, $\eta_{Q C D \sim 0.8}$
- $B_{B}$ and $f_{B}$ are currently determined only theoretically.
- $f_{B}$ very difficult to measure experimentally $(\mathbf{B} \rightarrow \mathbf{I} \mathbf{v}$ ).
- Best hope lattice QCD, slightly more precise for Bs mixing
- Ratio needed in UT (cancels parameters)
$\left|\mathbf{V}_{\mathrm{td}}\right|^{2} /\left|\mathbf{V}_{\mathrm{ts}}\right|^{2}=\left[(1-\rho)^{2}+\mathrm{n}^{2}\right]$

$$
\frac{\Delta m_{s}}{\Delta m_{d}}=\frac{m_{B_{s}}}{m_{B_{d}}} \xi^{2}\left|\frac{V_{t s}}{V_{t d}}\right|^{2}
$$

| $\mathrm{ps}^{-1}$ | Belle/Babar | WA(inc LHCb) | $\Delta \%$ |
| :--- | :--- | :--- | :--- |
| $\Delta \mathrm{~m}_{\mathrm{d}}$ | $0.508 \pm 0.005$ | $0.507 \pm 0.004$ | 0.8 |
| $\Delta \mathrm{~m}_{\mathbf{s}}$ |  | $17.72 \pm 0.04$ | $\mathbf{0 . 2}$ |

## $\mathrm{V}_{\mathrm{tq}} \mathrm{I}$ Summary

- $\left|\mathrm{V}_{\mathrm{ts}}\right|=\left|\mathrm{V}_{\mathrm{cb}}\right|$ with UT constraint,
- Can also precisely extract $\left|\mathrm{V}_{\mathrm{ts}}\right|$ from $B\left(B \rightarrow X_{s} \gamma\right)$
UT sides at $\mathrm{e}^{+} \mathrm{e}^{-}$, FPCP 2013

## Most precise $\left|V_{\text {tq }}\right|$ (PDG)

$\rightarrow \mathrm{B}^{\circ} \rightarrow \rho^{\circ} \rho^{\circ}$

## Aside: The origin of "penguins"

## Symmetry Magazine Jan/Feb 2007

## The origin of penguins

Told by John Ellis:
"Mary K. [Gaillard], Dimitri [Nanopoulos], and I first got interested in what are now called penguin diagrams while we were studying CP violation in the Standard Model in 1976... The penguin name came in 1977, as follows.
In the spring of 1977, Mike Chanowitz, Mary K. and I wrote a paper on GUTs [Grand Unified Theories] predicting the $b$ quark mass before it was found. When it was found a few weeks later, Mary K., Dimitri, Serge Rudaz and I immediately started working on its phenomenology.

That summer, there was a student at CERN, Melissa Franklin, who is now an experimentalist at Harvard. One evening, she, I, and Serge went to a pub, and she and I started a game of darts. We made a bet that If I lost I had to put the word penguin into my next paper. She actually left the darts game before the end, and was replaced by Serge, who beat me. Nevertheless, I felt obligated to carry out the conditions of the bet.

For some time, it was not clear to me how to get the word into this b quark paper that we were writing at the time.... Later...I had a sudden flash that the famous diagrams look like penguins. So we put the name into our paper, and the rest, as they say, is history.

$C_{\pi^{+} \pi^{-}} \neq 0$, and $S_{\pi^{+} \pi^{-}}=\sqrt{1-C_{\pi^{+} \pi^{-}}^{2}} \sin 2 \alpha_{\text {eff }}$
$\rightarrow$ Observed two types of CP violation:

- Direct : C $\neq 0$
- Mixing-induced: $S \neq 0$

$$
\sigma\left(\alpha_{e f f}\right) \sim 4^{\circ}
$$

BND School, B physics \& CP Violation
Phillip URQUIJO

## From $\alpha_{\text {eff }}$ to $\alpha$ : Isospin Analysis

To correct for penguin contribution: Gronau-London method (isopsin triangles).
From flavour tagged decay rates of $\Pi^{+} \Pi^{-}, \pi^{+} \pi^{0}, \pi^{0} \pi^{0}$

$$
\begin{aligned}
&\left|\pi^{+} \pi^{-}\right\rangle=\sqrt{\frac{2}{3}}|\pi \pi, I=0\rangle+\sqrt{\frac{1}{3}}|\pi \pi, I=2\rangle \\
&\left|\pi^{0} \pi^{0}\right\rangle=\sqrt{\frac{1}{3}}|\pi \pi, I=0\rangle-\sqrt{\frac{2}{3}}|\pi \pi, I=2\rangle \\
&\left|\pi^{+} \pi^{0}\right\rangle=|\pi \pi, I=2\rangle \\
& \square \frac{1}{\sqrt{2}} \bar{A}^{+-}+\bar{A}^{00}=\bar{A}^{0-} \\
& \frac{1}{\sqrt{2}} A^{+-}+A^{00}=A^{0+}
\end{aligned}
$$

$$
\arg \left(A^{+-} / \widetilde{A}^{+-}\right)=2 \Delta \alpha=2\left(\alpha-\alpha_{\text {eff }}\right)
$$

Ambiguities: 4 triangle orientations $\Rightarrow 4$-fold ambiguity for $\Delta a$
$\alpha \leftrightarrow \pi-a \Rightarrow 8$-fold ambiguity for $a$
BND School, B physics \& CP Violation
Phillip URQUIJO

65

## $\alpha$ from Isospin Analysis

Input: $B F\left(B^{0} \rightarrow \pi^{+} \pi^{-}\right), B F\left(B^{+} \rightarrow \pi^{+} \pi^{0}\right), B F\left(B^{0} \rightarrow \pi^{0} \pi^{0}\right), C_{+-}, S_{+-}, C_{00}$
Find minimum $\chi^{2}$ in fit of isospin triangle to measurements. compute C.L.

Belle: $11<\alpha<79^{\circ}$ excluded at $95 \%$ C.L. $\quad \alpha$ (degrees)

More promising: $\mathrm{B} \rightarrow \mathrm{\rho} \mathrm{\rho} \quad-5 \times$ larger BF

- Much smaller penguin pollution: $|P / T| \sim 4 \%$
- Final state is mix of CP-odd and CP-even, but CP-even (longitudinal polarization) dominates

## Experimental Situation

1. (Ideally) Use modes with small penguin contributions
2. Correct for penguin effects (isospin analysis)

Phillip URQUIJO

## Dalitz Plot Measurement

Compare regions of Dalitz space and quantify difference. ${ }_{\text {PRD }} 85,112014$ (2012).
